ELECTRIC ALLROUNDER

The benchmark for high-end part production
PROFIT-ORIENTED

Typically electric:
Easy implementation of demanding tasks.
We set standards! And that applies to our electric ALLROUNDERs too. What does this mean for you? It means, for example, that our drives are designed according to the highest functional and quality criteria – “Made by ARBURG – Made in Germany”. Regardless of whether you’re working with our GOLDEN ELECTRIC general purpose machine series or our high-precision ALLDRIVE, and whether medical technology, packaging, or the automotive industry is your specialism, we provide easy, highly efficient solutions for producing challenging molded parts.

WIR SIND DA.
Cost-effective performance that's simply outstanding: With a perfect spectrum of machine dimensions available, our electric machines are suitable for all of your applications. The GOLDEN ELECTRIC is our standardized general purpose machine series at an unbeatable price. To meet more demanding equipment requirements and support more challenging production tasks, our ALLDRIVE offers the features you need. Choose your electric ALLROUNDER from one of the most comprehensive ranges in the industry.

AT A GLANCE

Modern machine technology for greater all-round efficiency

- Short dry cycle times as well as simultaneous machine movements
- Reproducible mold filling
- Extremely low energy requirement
- Low cooling requirement and noise level
**Speed**

Injection, dosing, and opening and closing of the mold are servo-electrically driven as standard on GOLDEN ELECTRIC and ALLDRIVE machines – allowing fully independent operation. Fast acceleration and speeds, as well as simultaneous movements, enable high-speed cycles.

**Precision**

Play-free, direct-acting spindle gear units make for mechanically rigid drive axes and dynamic movements. The excellent positioning accuracy of servo-electric drives results in maximum reproducibility and part quality.

**Minimum emissions**

The liquid-cooled drives operate quietly without air turbulence and reduce emissions into the environment. Closed drives and spindle systems prevent exposure to dust caused by abrasion. Perfect conditions for use in pure production environments.

**Energy efficiency**

The toggle-type clamping unit, the high efficiency of the servo-electric drives, as well as the recovery of braking energy to the grid form the basis for outstanding energy efficiency. The energy requirement is reduced by up to 50 percent.

**Value**

Numerous technical details enable the machines to operate with exceptional reliability and minimal variations in the process. These include, for example, the closed cooling circuit of motors and converters for fast cycles and long holding pressure phases.

---

**GOLDEN ELECTRIC**

Distance between tie-bars: 370 - 570 mm  
Clamping forces: 600 - 2,000 kN  
Injection units: 170 - 800

**ALLDRIVE**

Distance between tie-bars: 270 - 1120 mm  
Clamping forces: 350 - 6,000 kN  
Injection units: 5 - 2100

---

High-quality technology without compromise: Servo motors are generally liquid-cooled.
What does the future of injection molding technology look like? One marked trend is the growing proportion of electric machines in injection molding plants worldwide. With our GOLDEN ELECTRIC series, we are following this trend and have been guided by your requirements in its development. To achieve this, we’ve created a golden recipe for success: The use of proven, uncompromising high-end technology at an unbeatable price. Ideal for producing your quality parts even more profitably!
Highly compatible: The tie-bar spacings, cylinder modules, and operational philosophy are identical across all machine series.

The Golden touch: High-end standards such as play-free spindle gear units.
ALLDRIVE: MORE EQUIPMENT – MORE FLEXIBILITY

---

Need more flexibility in your equipment? Looking for high-precision solutions to challenging production tasks? Want to maximize your productivity? Our ALLDRIVE machines can be individually adapted using a variety of performance variants. That leaves you the freedom to choose exactly what your area of application requires.

---

**Performance variants**

**L1:** The basis for all our electric ALLROUNDERs. Designed for technical parts and particularly energy-saving operation.
- Performance specification similar to standard hydraulic machines
- Serial movements by secondary axes (ejector, nozzle movement, and core pull) via servo hydraulics
- Regulated mold locking in two stages possible (not for GOLDEN ELECTRIC)

**L2:** An alternative for the ALLDRIVE in high-speed applications and complex processes.
- Shorter dry cycle times and higher injection speeds
- Simultaneous movements of secondary axes via small hydraulic accumulator system
- Regulated mold locking in several stages possible
- Dosage across cycles possible

**L3:** An alternative for the ALLDRIVE in the case of thin-walled applications and the highest demands on machine performance.
- All adaptations of performance variant L2
- Even greater injection speeds

---

100,000,000 CYCLES

This record number for an ALLDRIVE shows just how reliably the electric machines operate.
Ready for digitalization: ALLROUNDER 630 A to 1120 A machines with a clamp design are equipped with not only connectivity modules, but also assistance packages as standard.
High-end drive systems make our electric ALLROUNDERS extremely economical in every production application. Despite their high dynamics, these machines are extremely energy-efficient in operation. This is due to the servo-electric drives that are used for all important movements – and are available in several performance variants. When it comes to the secondary axes for the ejector, nozzle movement, and core pull, you can choose between hydraulic and electric alternatives. This enables you to coordinate the machine and application precisely with individual customization.

DRIVE SYSTEMS: ENERGY-EFFICIENT

Play-free and precise: GOLDEN ELECTRIC machines use ball screw drives.

Exceptionally durable and precise: The highly resilient planetary roller screw drives in our ALLDRIVE machines.

Efficient: Integrated hydraulics are ideal for high ejector and nozzle contact forces.
Servo-electric drives

Injection, dosing, and mold opening and closing are servo-electrically driven – with energy-saving, high-precision, and frequently simultaneous movements included. The technical high-end solutions used in this case:

- Play-free power transmission with direct-acting spindle gear units
- Liquid-cooled servo motors ensure smooth running, temperature stability, and operational safety with less air turbulence
- Closed cooling circuit for the motors and converters
- Recovery of braking energy

Integrated hydraulics

The secondary axes are hydraulically driven, while the ejectors and core pulls are also available in servo-electric versions. The servo hydraulics make for energy-efficient serial sequences. A small hydraulic accumulator system is available as an alternative for simultaneous sequences and particularly complex molds. Want to use molds with hydraulic functions? No problem with our electric ALLROUNDER machines!

High availability

Our robust drive systems are the basis for long, stable, and fault-free running times. The automatic central oil lubrication system and the grease lubrication points that converge at a central point outside the paneling minimize maintenance overheads for the toggle-type clamping units. Since lubrication can take place during operation without interrupting production, availability is increased. Lubrication intervals are calculated individually, depending on the forces, speeds, strokes, and times that have been set. This type of predictive maintenance saves operating time and minimizes costs. All this means greater cost-effectiveness in day-to-day operation.
Highly precise and economical: our electric toggle-type clamping unit. Save money daily with energy-efficient running characteristics! The kinematics of the double five-point toggle system are optimized for the servo-electric drive. The application-focused design of the drive systems on the GOLDEN ELECTRIC and ALLDRIVE machines ensures short dry cycle times. In addition, the simultaneous movements of the clamping unit and ejector considerably reduce cycle times in your production facility.

Compared to a standard hydraulic machine, up to 2 seconds shorter dry cycle time.

CLAMPING UNITS: FAST

Easy to access: Cross-series ejector quick-connect coupling simplifies setup.

Generous installation space and opening stroke: Suitable for large molds too.
Five-point toggle system
The double five-point toggle system features a stable construction with multiple guidance points. This results in absolutely symmetrical force application during movements and mold locking – even with heavy molds. Despite the compact design, large opening strokes are possible.

Protective mold insert
The box-type construction of the movable mold mounting platen is longitudinally guided and supported. Together with four tie-bar guidance, this results in high-level parallelism and precision for extended periods between mold maintenance. Highly sensitive tie bar strain measurement ensures active mold protection.

Precise positioning
The centerpiece of our mechanically rigid closing system: Play-free spindle gear units. This enables us to assume all positions with a high degree of precision. This simplifies the transfer of parts to robotic systems.

Clamping force regulation
Electrical adjustment provides a convenient means of adapting the toggle to different mold installation heights. The clamping force regulation (for ALLDRIVE, depending on the size and performance variant) generates a consistent locking force and thus automatically compensates for the thermal expansion of the mold.

Near-mold media connections (optional): Increased protection towards the back of the machine provides for a great deal of free space.

Electric mold height adjustment: Effective help for short setup times.

Servo-electric ejector (optional): Highly precise dropping of molded parts for even shorter cycle times.
Homogeneous material preparation and precise injection form the basis for high-quality part production. This is ensured by the mechanically rigid drive axes, for example, which enable excellent process control. Another benefit is found in potential energy savings. With the ALLDRIVE, you maintain full control of your cycle times thanks to simultaneous machine movement and dosage across cycles. Our injection units can also be converted and cleaned quickly – another clear advantage for you.
Wide variety of combinations

The cylinder modules are compatible with all series and are finely graded. A number of versions ensure optimum protection against wear. Moreover, screws with non-standard geometries allow you to process all common plastics.

Torque-free nozzle contact

Our two-tie-bar guidance facilitates absolutely leak-tight nozzle contact – also ideal for both flat and extended nozzles. The build-up of the nozzle contact forces is programmable and regulated, which reduces wear on the nozzle and mold.

Servo-electric injection

Reproducible mold filling is achieved by force-regulated and position-regulated injection, dynamic acceleration, and precise pressure detection via sensors close to the axis. Liquid-cooled motors enable fast cycles and long holding-pressure phases.

Direct dosing drive

The independent servo-electric injection and dosing drives allow for regulated dynamic pressure and increase both energy efficiency and precision. Since the melt can be dosed simultaneously across cycles on the ALLDRIVE, it can also be processed faster and more gently.
Maintaining control over the machine, mold, robotic technology, and peripheral technology requires a suitably powerful central control system. This calls for smart technology that offers extensive data integration options, monitors and adaptively controls your process, and supports you in every operating situation. All the features of our SELOGICA and GESTICA control systems are designed for fast, secure, and convenient setup and operation. This allows you to get the best out of all your applications.

**Highlights**

- SELOGICA and GESTICA – fully compatible
- Graphics-based sequence programming
- Real-time plausibility check
- Assistance packages and connectivity modules – ready for digitalization
- Central control system for complete production cells

More information:
SELOGICA and GESTICA brochure
Central management
Thanks to its unsurpassed standard operational system, the SELOGICA saves time and costs. Easy integration of a wide variety of peripheral equipment facilitates sequence management even for complete production cells, with only one data set. Short cycle times? They’re programmable!

Intuitive operation
The graphics-based operational philosophy is intuitive and consistently geared towards process optimization. Our unique graphics-based sequence programming with real-time plausibility check always clearly indicates the logical position of the current programming step. Operating errors? Out of the question!

More efficient operation
Easy setup and fast startup. Assured part quality and excellent productivity. Controlled system status and time-saving support. Higher-level data exchange and more transparency. Our assistance packages and connectivity modules provided as standard form the basis for all these benefits. Ready for digitalization? Of course!

The pioneering GESTICA control system builds on the comprehensive performance of the SELOGICA system. Gestures and added assistance make operation even more straightforward and intuitive.

The SELOGICA control system offers a whole range of functions for specialized technology – even non-standard sequences are handled as though they were standard.

The new design of the SELOGICA ND operating panel is based on the look of the GESTICA.
APPLICATIONS: IN PRACTICE

Our electric ALLROUNDER machines provide the ideal solutions for medical technology parts in the clean room, packaging in large unit volumes, safety-related products in the automotive industry, or even reproducible production of precision small parts at a constant quality level. Whether you choose our attractive GOLDEN ELECTRIC general purpose machine series or the highly precise, individually adjustable ALLDRIVE, our high-end technology proves its worth day after day – directly in your production operations.

Challenging technical parts: Complete turnkey systems from a single source.

Mass-manufactured medical items: Profit-oriented unit costs thanks to short cycle times.

More information: Turnkey projects brochure
Rain/light sensor (automotive)

High-output production: Synchronous ejection speeds up cycles.

Micro-injection molding: Extremely small shot weights thanks to the size 5 micro-injection unit.

Film insert molding: Excellent reproducibility with servo-electric drives.
